Repeatable Unit Testing of Distributed Interactive Simulation (DIS) Protocol Behavior Streams using Web Standards

"A Stream is a Stream"

2021-SIW-Presentation-028

Don Brutzman, Naval Postgraduate School (NPS), USA

Tobias Brennenstuhl, German Army, Germany

Terry Norbraten, Naval Postgraduate School (NPS), USA

Problem Statement

- It is hard for simulation systems to interconnect, especially with partner nations and C2 systems
- Utilizing open-source Web Technology is a valuable resource that can help numerous systems regardless of data classification
- Partnerships with NATO partners are needed to improve shared understanding of mutual goals and challenges
- M&S is not relevant to active warfighting unless we can achieve interoperability between Live, Virtual and Constructive (LVC) simulations, robot telemetry, and Command and Control (C2)

Thesis Motivation: Basic Premises

- **A stream is a stream, at rest in a file or in motion over network**
 - Playback recorded manipulation of a model using PDUs
 - Stream manipulation of models using OpenDIS7 library
- **Multiple open-source codebases available, initially Java**
 - more languages to follow (JavaScript, Python, XML, JSON, etc.)
- **X3D Graphics standard allows dynamic 3D in any Web browser**
 - Record remote animation of a model using PDUs
 - Distill concise first-order linear interpolators from streams

Research Questions

- **Stability of IEEE DIS specs and capabilities of MOVES LVC Lab offer excellent new opportunities for broad interoperation**
 - Open-source codebase by Mike Bailey offers entire vocabulary
 - Curt Blais dissertation work on Rich Semantic Track (RST)
 - How can these best be adapted and applied?
- **How to promote DIS behavior streams as first-class media type?**
 - Coherent data streams for collaboration, simulation, telemetry
 - Unit testing of recorded streams for adaptable repeatability
 - Establish archivable annotated records of simulation activity

What is IEEE DIS Protocol?

- Distributed Interactive Simulation (DIS) is an Institute of Electrical and Electronics Engineers (IEEE) standard for conducting real-time platform-level wargaming across multiple host computers and is used worldwide, especially by military organizations and other agencies.
- Wikipedia: Distributed Interactive Simulation (DIS)
- Simulation Interoperability Standards Organization (SISO): "Simulation Interoperability and Reuse through Standards"
- SISO DIS / RPR FOM Product Support Group (PSG)

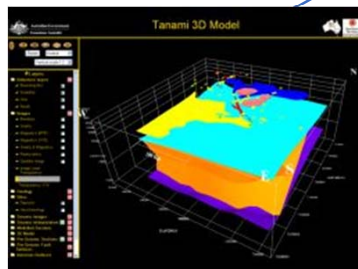

What is X3D4 Graphics?

X3D Anywhere

Extensible 3D (X3D) Graphics is the royalty-free open standard for publishing, viewing, printing and archiving interactive 3D models using Web technology.

Way Ahead and Future Work

- **Further test Java implementation, then create Python, JavaScript**
- **Expand X3D capture/conversion/replay code for multiple entities**
 - Further optimization coding of Sliding Window Algorithm
- **Assess Spiders3D with JavaScript Virtual Environment Web Server**
- **Collaborate on distributed LVC models and simulations**
 - Take advantage, test campus-wide Multicast capability
 - Test with #Xj3D Java-based X3D browser
 - Explore possible HPC network connection to Germany, Poland
 - Consider NATO C2SIM and CWIX 2021 participation
- **Continue Experimentation and Unit Testing!**

REPEATABLE UNIT TESTING OF DISTRIBUTED INTERACTIVE SIMULATION (DIS) PROTOCOL BEHAVIOR STREAMS USING WEB STANDARDS, Tobias Brennenstuhl, Masters Thesis, NPS, June 2020, <https://calhoun.nps.edu/handle/10945/65436>

Abstract. The IEEE Distributed Interactive Simulation (DIS) protocol is used for high-fidelity real-time information sharing among simulations and trainers across the entire international Modeling and Simulation (M&S) community. If archivally saved and replayed, DIS streams have the potential to become a valuable source of Big Data. The availability of archived prerecorded behavior streams for replay, adaptation, and analysis can benefit an immense variety of application areas. The computer science principle “a stream is a stream” indicates that data in motion is equivalent to data at rest. This characteristic can enable powerful capabilities for DIS. This thesis presents prototypes to demonstrate how various forms of repeatability are key to gaining improved benefits from DIS stream analysis. Unit testing of DIS behavior streams allows confirmation of both repeatability and correctness when testing all manner of applications, exercises, simulations, and training sessions. A related use case is automated after-action review (AAR) from recorded DIS streams. This thesis also shows how a DIS stream is converted into autogenerated code that can animate an X3D Graphics model. Many obstacles were overcome during this work, and so various best practices are provided. Of note is that unit testing might even become a contract requirement for incrementally developing and stably maintaining Live Virtual Constructive (LVC) code bases. Recent progress includes autogeneration of all SISO enumerations as Java classes and development of a complete type-safe XML Schema for a DIS-XML encoding as well. This progress provides many opportunities for future work including C-DIS and DISv8 activity.

Questions and contributions always welcome!
